

Task 1:

Found 0 (127)	Found 1 (127)	Found 2 (127)
Found 3 (127)	Found 4 (127)	Found 5 (113)

Nick Leung EE446 SP26 Lab 7 Report

[illegible]

Task 3:

Found 0 (127)		Found 1 (127)		Found 2 (127)
Found 3 (127)		Found 4 (127)		Found 5 (127)
Found 6 (127)		Found 7 (127)		Found 8 (127)

		
---	--	--

Task 4:

I observed that the baseline and fine-tuned models had challenges with recognizing some numbers. For example, the baseline model couldn't predict 5's well, and the finetuned model couldn't predict 9's well. My partner created data for 9's on the fine-tuned model, and that could be why my way of drawing 9's was difficult.

The fine-tuned model performed better. It's more familiar with how I draw the numbers, and the confidence scores were generally higher than the baseline model. Freezing the earlier layers of the fine-tuned model makes it general enough to recognize digits. The later layers can extract more features specific to my drawings. Leaving the dense layer unfrozen also improves the class predictions. That could explain why my confidence scores were higher with the fine-tuned model.

Fine-tuning did help for my specific gesture style. For example, I struggled with drawing a 3 for the baseline model, but my fine-tuned model picked it up quickly.
